1. Abstract

Foodie Hub is a simple online food ordering website developed using **HTML, CSS, and JavaScript**. The purpose of the project is to create a website where users can view different food items, learn about the service, place an order, and contact the team.

The website has three main pages: **Home, Order Meals, and Contact**. The Home page introduces Foodie Hub and displays food categories and menu items. The Order page contains a form for placing an order, while the Contact page allows users to send a message. JavaScript is used for basic form validation and user feedback.

2. Introduction

Online food ordering websites make it easier for people to explore food and place orders. Our project, Foodie Hub, was created as a simple example of an online food ordering platform.

The main objectives of this project were to:

- Create a simple and attractive food ordering website.
 - Practice HTML, CSS, and JavaScript.
 - Create multiple connected web pages.
 - Display food items, descriptions, and prices.
 - Create order and contact forms.
 - Add basic validation and interaction using JavaScript.
 - Improve our practical web development skills.
-

3. Methodology / Implementation

We developed Foodie Hub using **HTML for the structure, CSS for the design, and JavaScript for basic interaction.**

Home Page

The Home page contains a navigation bar, an introduction to Foodie Hub, and a section explaining why customers should choose the service. It also displays different food categories, including **Pizza, Sushi, Fried Chicken, Tacos, Pasta, and Burger.**

A menu section shows selected food items with their descriptions and prices. CSS was used to arrange the food cards and add features such as shadows, rounded corners, and hover effects.

Figure 1: Foodie Hub Home Page

```
<html>
  <body>
    <header>
      <div>
        <img
          />
        <h1>Welcome to Foodie Hub_Order your favorite meals instantly!</h1>
      </div>
    </header>
    <h1
      style="color: □black; margin: 40px; text-align: center; padding-top: 20px"
    >
      About Foodie Hub
    </h1>

    <section id="C">
      <div>
        <p style="line-height: 2">
          <b>At Foodie Hub</b>, we believe that extraordinary food should always
          be just a click away. We□ve made it our mission to connect food lovers
          with the finest local restaurants and talented chefs in town. Whether
          you□re looking for a quick weekday bite, wholesome healthy options, or
```

Order Page

The Order Meals page contains a form where users can enter their **name, phone number, address, food item, quantity, and payment method**.

JavaScript checks whether the required information has been entered. If something is missing, the user receives an alert. When the information is complete, the website shows an order confirmation message and clears the form.

Figure 2: Order Page

```
<html>
<html lang="en">
<body>
  <section id="order">
    <h1>Place your orders:</h1>

    <div class="form">
      <div class="photo">
        
      </div>

      <div class="order-box">
        <h2>Place Your Order</h2>

        <form id="orderForm">
          <p>Name</p>
          <input type="text" placeholder="Your name" id="name" required />

          <p>Phone Number</p>
```

Figure 3: Order Form JavaScript

```
const form = document.getElementById("orderForm");

form.addEventListener("submit", function (e) {
  e.preventDefault();

  const name = document.getElementById("name").value;
  const phone = document.getElementById("phonenumber").value;
  const address = document.getElementById("address").value;
  const payment = document.querySelector("input[name='pay']:checked");

  if (name === "" || phone === "" || address === "") {
    alert("Please fill in all fields");
    return;
  }

  if (!payment) {
    alert("Please select a payment method");
    return;
  }

  alert("Order placed successfully!");
  form.reset();
});
```

Contact Page

The Contact page provides a form for users to send a message. It includes fields for **first name, last name, email, phone number, and message**.

JavaScript checks that the first name, email, and message have been entered. If they are complete, a confirmation message is displayed.

Figure 4: Contact Page

```

<html lang="en">
<body>
  <header>
    const email = document.getElementById( 'email' ).value,
    const message = document.getElementById("message").value;

    if (firstName === "" || email === "" || message === "") {
      alert("Please fill in First Name, Email, and Message.");
      return;
    }

    alert("Thank you! Your message has been sent successfully.");

    form.reset();
  });
</script>
</body>

```

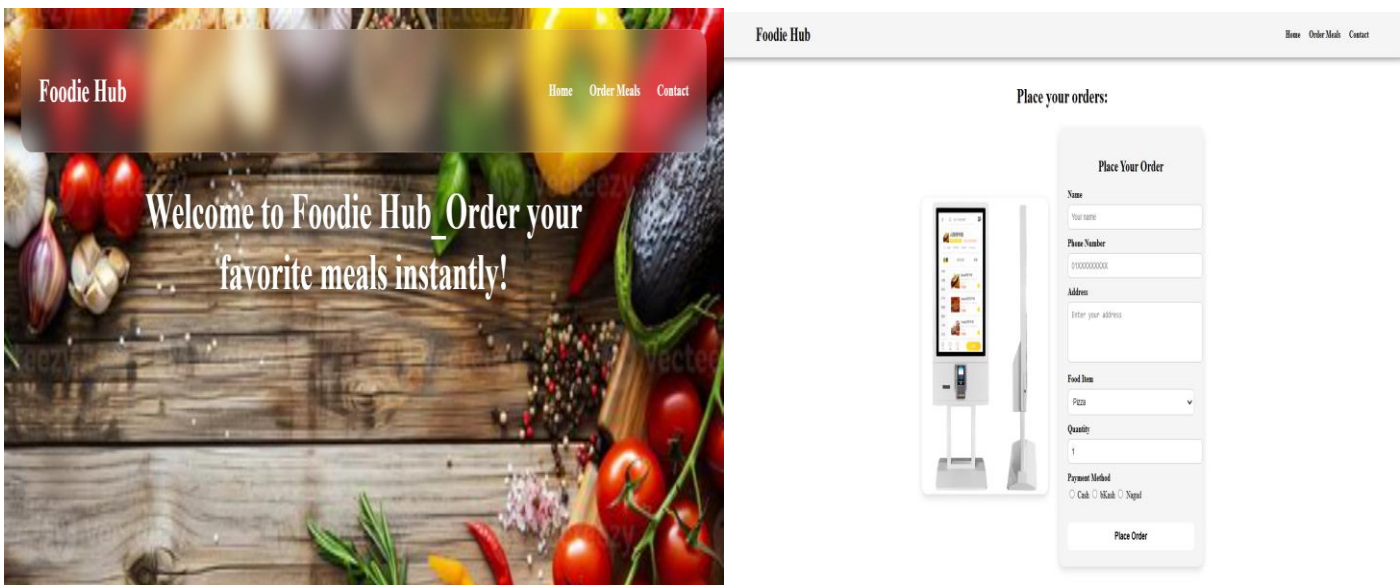

4. Results / Output

The final website successfully displays the main features planned for the project. Users can move between the three pages using the navigation bar.

The Home page displays the food categories and menu. The Order page allows users to enter their order information, and the Contact page provides a way to send a message.

The JavaScript validation also works as expected by showing messages when required information is missing and confirming successful form submission.

5. Challenges and Limitations

One of the main challenges was arranging the different sections and food cards properly. We used **Flexbox and CSS Grid** to make the layout more organized.

Another challenge was adding form validation with JavaScript and making sure the forms responded correctly to different inputs.

The main limitation of the project is that it is a **front-end website**. It does not have a database or back-end system, so orders and messages are not actually stored. The payment options are also only displayed in the form and do not process real payments.

6. Conclusion and Discussion

Foodie Hub successfully demonstrates a basic online food ordering website using HTML, CSS, and JavaScript. The project includes a home page, food menu, order form, contact form, navigation, and basic JavaScript validation.

Through this project, we gained practical experience in creating web pages, styling them with CSS, using forms, and adding simple JavaScript functionality. Although the website does not have a back-end system, it successfully meets the main objectives of the project.

7. Future Work

In the future, the website could be improved by adding:

- A database to store orders and customer information.
 - User registration and login.
 - A shopping cart.
 - Real online payment.
 - Order tracking.
 - Food search and filtering.
 - Better form validation.
 - More responsive design for mobile devices.
-

8. References

1. MDN Web Docs – HTML, CSS, and JavaScript documentation.
 2. W3Schools – HTML, CSS, and JavaScript tutorials.
 3. Online image sources used for the food and website images.

9. Individual Contributions

Team Contribution

Arian Poya

Arian mainly worked on the **HTML and CSS** parts of the Foodie Hub website. She helped create and organize the HTML structure of the pages, including the navigation bar, food sections, menu, order form, and Contact page. She also worked on the CSS design, including the layout, colors, buttons, images, food cards, shadows, hover effects, and responsive design. In addition, Arian helped test the website and fix design and layout issues.

Khadija Ebrahimi

Khadija contributed mainly to the **Home page** of the Foodie Hub website. She helped organize the page content, add food categories and menu items, work with images, and arrange different website sections. Khadija also helped with the **JavaScript for the Order form**, including the validation and checking of customer information and order details. She also participated in testing and reviewing the website.

Benafsha

Benafsha worked specifically on the **Contact section** of the Foodie Hub website. She developed and organized the Contact form, including fields for customer information, and helped implement the **JavaScript validation for the Contact form**. She also helped test and review the final website to make sure the Contact section worked correctly.

All three members worked together during the development and testing of the project. The team discussed the design, reviewed the website, fixed problems, and prepared the final project and report.
